ANUUTECH

Proof of Hash Simplified

The Human Side of PoH

PoH (Proof of Hash) is the first building block of AnuuTech Ltd. The future of AnuuTech will be a fully layer 1 network, starting with PoH, our first piece of technology. PoH is a simple technology, which will change the way we all will be able to handle data in the future and make everyone feel much more secure. What it does is very simple - it is protecting the integrity of data in a unique way. There are two essential things you need to know about PoH.

First of all, PoH it's a technology that provides integrity protection of your data input. It takes your data input and, through several steps, creates a master hash in which your original data input is kept. Then our system will check the master hash to make sure that nothing has been tampered with.

Secondly, PoH doesn't care what kind of data you feed it. It can be a document, an image, a transaction, an NFT, a weblink - any kind of data….

PoH will process several validation transactions, using different node layers and security checks. This is making the system completely safe and unable to be hacked and every step is documented in our technical whitepaper.
PoH can be integrated into any business worldwide offering significant advantages. For example, integrate PoH into a NFT chain, will protect the ownership of every NFT even if a wallet gets hacked. Online notaries can use PoH to prove the deed of a house and make the entire process of buying a property a virtual occasion.

It can be integrated into any emailing system for the security of customers or employees. Emails with links can be protected by PoH, so anyone can click a link without having to worry about it being tampered with, if it is a hacker or a phishing link. PoH is also able to prevent cheaters sending emails pretending "as if" they are from a bank, a CEO or alike, asking for info and it can be hard to tell if it is correct or not.

In short, PoH is an external process, providing ideal security and functionality for any system. This will offer new opportunities and enable further expansions, making your company or organization grow by protecting the integrity of your data.

"A world of new possibilities awaits you."
